

Q1. need of correctness of algorithm.

- ensure \rightarrow algo developed \rightarrow satisfy the functional requirements.
- ensure \rightarrow soln for problem \rightarrow valid.
- check \rightarrow • given problem \rightarrow finiteness or infinite soln.
- efficient execution of tasks in comp.
- all cases in problem \rightarrow covered
- applⁿ correctness of algoⁿ \rightarrow safety of human life or costly equip.

To confirm correctness -

steps followed are \rightarrow

- Identify properties of input data \rightarrow preconditions
- Identify properties which must be satisfied by output data \rightarrow postconditions.

The algorithm is correct if it can be proved that if pre-condition is true, the post condⁿ must be true.

Pre-condⁿ \Rightarrow Post-condⁿ

If example is asked \rightarrow Travelling Salesman Problem.

- \rightarrow travels diff cities
- \rightarrow each city one & only once.
- \rightarrow total tour \rightarrow minimum cost

- every tour is examined & cost is computed
- Tour with minimum cost is examined & retained

Q2- Issues in designing iterative algorithm-

- Iterative algo \rightarrow recursive in nature
- In these types of algorithm \rightarrow function doesn't call themselves.

Reasons-

- Iterations using loop control structures \rightarrow eg \rightarrow for, while, repeat-until-
 i) Initial condⁿ ii) Terminating condⁿ iii) Invariant condⁿ.
- Improving efficiency of algo -
 - eliminate redundant computation \rightarrow loop
 - Reducing reference to array \rightarrow in loop
 - Avoiding last termination of a loop
 - early detection of expected output condⁿ.
- Estimation of Space & time requirements -
 \rightarrow amt of computer time requ^d to run algo.
- Expressing complexities using order notations-
- Applying different algorithmic strategies-
 - \rightarrow Brute Force
 - \rightarrow Divide & Conquer
 - \rightarrow Dynamic Programming
 - \rightarrow Greedy Technique
 - \rightarrow Backtracking.

Algorithm & characteristics

→ step by step procedure which defines a set of instructions to be executed in certain order to get desired output.

characteristics -

- 1) Input - algo → zero or more inputs.
each operⁿ → fundamental operator
- 2) Output - algo → atleast one output.
each operⁿ → fundamental operator → zero or more inputs
- 3) Definiteness - all instⁿ → algo → unambiguous, precise & easy to interpret
- 4) Finiteness - algo → must terminate after a finite no. of steps in all test cases.
- 5) Effectiveness - develop algo → very basic, simple & feasible operations so that it can be traced.

- good algo → precise & unambiguous → every step
- same problem → diff algo strategies
- same algo → multiple ways.
- legitimate inputs → algo → well specified.

Q4 Algo as Technology.

- algo \rightarrow tool to utilize reasonable amount of execⁿ time & memory space.
 - diff algo $\xrightarrow{\text{help}}$ diff places
 - every algo \rightarrow own space & time complexity
 - Fundamental concept \rightarrow CS & plays crucial role in various field such as ai, cryptography, etc.
- execution of algo \rightarrow 1) selection of efficient algo
- 2) Fast Hardware upon which algorithm is executed.

eg \rightarrow GPS navigator system in smartphone.

- Two algo Insertion sort (less efficient)
Merge sort (more efficient)

Comp A.

Comp B \rightarrow Merge sort \rightarrow execution efficient.
 \swarrow hardware plays imp. role.

eg \rightarrow AI, embedded system, robot's, Networking, web designing, etc.

Q. 86-

Problem Solving Strategies -

- different algorithms solve diff problems

1) Divide & Conquer -

- breaks down a large problem into smaller, more manageable subproblems.
- Top down approach
- combine solⁿ of subproblem to whole original problem.

2) Brute Force -

- Technique with naïve approach.
- finds all possible solutions to find satisfactory solⁿ.
- wide range of domains.

3) Dynamic Programming -

- bottom up approach.
- results of smaller recurring instances used to solve.

4) Trial & Error -

- diff solⁿ & observing outcomes until right one is found.
- repeated attempt
- example - arranging a puzzle.

5) Greedy Technique

- locally optimized decisions -
- looks best at moment (decision)
- no guarantee of optimal solⁿ.
- close to optimal value.
